

BANKING MANAGEMENT SYSTEM

(WEEK 1)

ALGORITHM

1	Start the program.
2	Create an ArrayList<Account> to store account details in memory.
3	Display the main menu: 1. Create Account 2. Deposit Money 3. Withdraw Money 4. Check Balance 5. Exit
4	Read the user's choice.
5	If the choice is Create Account: • Read Account ID, Account Holder Name, and Initial Balance. • Search the ArrayList using a loop. • If the Account ID already exists, display "Account ID already exists." • Otherwise, create an Account object and add it to the ArrayList.
6	If the choice is Deposit Money: • Read Account ID and deposit amount. • Search for the account using a loop. • If found, add the amount to the balance. • Otherwise, display "Account not found."
7	If the choice is Withdraw Money: • Read Account ID and withdrawal amount. • Search for the account using a loop. • Check whether sufficient balance is available. • If sufficient, deduct the amount. • Otherwise, display "Insufficient balance."
8	If the choice is Check Balance: • Read Account ID. • Search for the account using a loop. • If found, display Account ID, Account Holder Name, and Balance.
9	If the choice is Exit: • Display a thank-you message and terminate the program.
10	For choices 1–4, return to the main menu.
11	Stop.

WEEK 1 TECHNICAL FOCUS

- Uses **ArrayList<Account>** for storage.
- Uses Encapsulation (private data members and public methods).
- Uses manual loops for searching and validation.
- No file handling or database.
- All data is temporary and will be lost when the program terminates.
